Case Studies

Case Study 1 - Distribution Centre

Bowmer & Kirkland required three safety lines to provide safe access to the roof of a new distribution centre...

The Solution After a period of consultation with the architect it was agreed that HRS Services should install a system using force management posts fixed directly to the cladding...

Case Study 2 - Leeds Kirkgate Market

Achieving safe access to the roof areas of historic buildings can be particularly challenging. Structures can be uneven & of unknown strength...

Solving the problems presented at the 1904 hall of Leeds Kirkgate Market is a fine example of HRS Services work. Several hundred metres of rotting wooden duckboard walkway over the gutters were situated next to a glass roof of unknown strength...

The Solution The old walkway was removed safely using rope access techniques & replaced with light weight, durable & maintenance free Glass Reinforced Polymer Grating...

Fall Protection - Safety Solutions

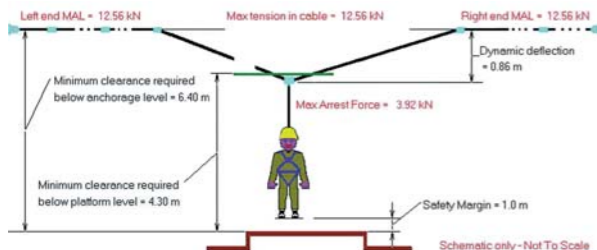

Fall Protection Services

We offer a range of solutions to 'working at height' safety requirements. With a proven background of both retro-fit and new build contracts, we have a breadth of knowledge and experience that spans the industrial and domestic markets.

HRS Services work nationally with a flexible, customer focussed service to ISO 9001:2000. Fall protection systems are installed on a diverse range of structures, such as composite clad warehouses, listed buildings, bridges & electricity pylons. Architects & construction companies can contact HRS Services early in a project's development in order to incorporate fall protection & access solutions into the structure of their buildings.

System Design

Each system is unique in both the structure to which it is being fixed & the end user requirements. HRS Services work closely with architects, structural engineers, main contractors & safety system manufacturers to ensure an optimum level of safety is achieved. In many cases specialist computer software is used to simulate the forces that would occur in a worst case scenario. Other factors taken into account are end user ability, size of budget & aesthetics.

Safety Line Systems

HRS Services offer both synthetic & stainless steel cable systems. The synthetic cable system dramatically increases the distances permitted between supports. Other system components make extensive use of 316 grade stainless steel. Force Management posts have been specially designed for direct attachment to modern roofing. This includes built up or composite metal pitched, standing seam, & single ply membrane systems. Force Management Posts come with a 25 year performance & corrosion resistance guarantee & are approved by all major roofing manufacturers.

Rail Systems

HRS Services rail systems offer great versatility. Rail systems can be incorporated vertically into fixed ladders or run horizontally along metal pitched or standing seam roofing. The low profile combined with the benefits of a fully integrated system make it a favourite choice of architects. Because rail systems do not flex in the same way as a safety line, the distance over which a fall can be arrested is reduced. HRS Services will be able to provide expert advice on what system best suits your requirements.

Walkways

HRS Services are installers of a variety of uPVC & GRP composite walkways selected for their durability & lasting performance.

Abseil Systems

Rope access is increasingly becoming recognised as a safe & economical way of accessing & servicing large areas of a building. In particular it is used for window cleaning. HRS design & install systems such as abseil rails & eyebolts to provide safe & well placed anchors for the use of rope access technicians.

Freestanding Cantilevered Guardrail

HRS Services supply & install free standing guardrail edge protection to provide safe access to previously dangerous to access areas. Free standing, cantilevered guardrail allows for a permanent, collective safe access solution without the need to mechanically fix to building structures or penetrate through roof membranes. HRS's guardrail solutions conform to all relevant British Standards including BS 6399 parts 1 & 2.

Safety Systems Re-Certification

We inspect, pull test, recertify & repair fall protection systems of all types from a variety of manufacturers, including those installed by other companies. Our inspections are in line with manufacturer's guidelines & both BS EN 8437 & BS EN795.

Following our inspection & a successful test we provide our clients with a detailed report of our findings & issue a current certificate for the system. Our on site engineers are able to carry out a number of minor repairs on site during the inspection although extensively damaged systems may require a second visit.

On site engineers are also able inspect all associated user PPE (Personal Protective Equipment). We hold a database of all our client's systems so that clients are never without a current certificate or a safe, useable safety system.

End User Support

Once a solution is in place, HRS Services can provide end user training, complete annual inspections & maintenance work, & provide end user advice and assistance should it be required.
